

WARTHOG® Accessories

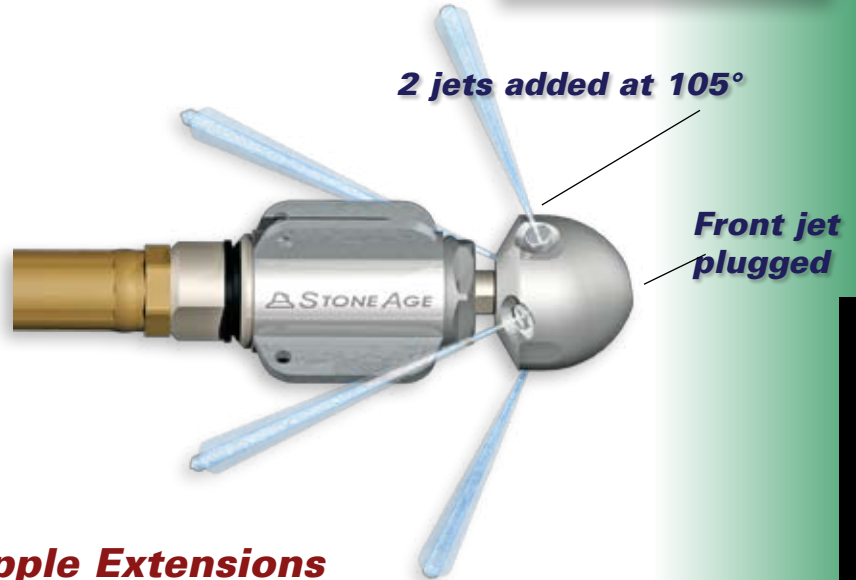

Extra Features Enhance Productivity

Descaling Jets

105° jet ports can be added to the rotating head to enhance removal of scale from a drain surface. (Not available with the **WT** model.) Tuberculation, corrosion products, soap, scale and minerals respond well to this option.

Note that the front port is intentionally plugged to allow more jetting force to be applied to the wall of the pipe. New tools can be purchased with this option or existing heads can be sent to us to be modified.

Super Centralizers & Nipple Extensions

We offer quality designed accessories to assist the performance of the **WARTHOG®** in a range of applications. We have several types centralizers that position the tool in the center of the pipe to allow for the best and most consistent cleaning for larger diameter pipes.

All models except the **WT** are offered with optional Super Centralizers. These accessories also keep the nozzle back from blockage, so the powerful front jet can do its work. Each of these Super Centralizers is made to be easily attached.

Nipple extensions and larger centralizers are also available for cleaning large diameter lines. These extensions maximize the jet's full power by moving the stream closer to the target surface. Standard extensions come in 2", 4", 6", 8", and 12" sizes, and we can make custom lengths for your specific requirements.

SEWER JETTING
